

Understand this codebase

How are averages for each region calculated?

For each metric, create lines on the radial plot that measure the averages from each of the regions in order from least to greatest

Where may this be happening at: Error: <circle> attribute cx: Expected length, "NaN".

For each line, can you put the circle's placement based off the scale for the metric? GDP PER CAPITA is on the scale of 1000s while GINI is on the scale of tens
